Replace the itemized list with the itemized list below:

— If an element section s is the root element section, then I_M(s) = mrt and elemTrans(I_M(s), namespace(s), I_A(s)), where mrt is the start mode of the NVDL script.

— If the parent section of an element section s is s', then applies(I_A(s'), path(s), I_M(s)) and elemTrans(I_M(s), namespace(s), I_A(s)).

⸺ If the parent element section of an attribute section a is s', then applies(I_A(s'), path(a), I_M(a)) and attTrans(I_M(a), namespace(a), I_A(a)).

Add the following note after NOTE 2:

NOTE 3   In the following script, there are two validate elements. Although they reference the same schema, they are two different actions. Given a validation candidate for the namespace "http://www.example.com", PlanElem contains one pair for the first action and another for the second action. As a result, this validation candidate is validated twice.
